 - Implement ArrayList Insert/Remove

```
We didn't plan to implement them at
void insert(int index, String s);
                                          that time and commenting out them
/* Remove the element at the specified index */
void remove(int index);
                                          will make our code cleaner
                                          We didn't plan to implement them and
                                          commenting them out will avoid a
                                          compiler error
                                   1 C. We were overloading those two
                                          methods
                                   2 D. None of the above
```

Why?

During the pre-lecture recording, we

commented out insert and remove method.

Ipublic interface StringList {

void add(String s);

int size();

String get(int index);

/* Add an element at the end of the list */

/* Get the number of elements in the list */

/* Add an element at the specified index */

/* Get the element at the given index */

In the ArrayStringList class, we have the following fields

String[] elements;

int size;

Lapacity

What's the point of having size as instance variable as the array elements already has size?

A. It is duplicate information for ease of use
B. It avoid calling element.length to save time 5
C. size indicates how full the array is
D. More than one of the above is correct

```
private void expandCapacity() {
    int currentCapacity = this.elements.length;
    if(this.size < currentCapacity) { return; }</pre>
    String[] expanded = new String[currentCapacity * 2];
    for(int i = 0; i < this.size; i += 1) {</pre>
        expanded[i] = this.elements[i];
    this.elements = expanded;
If I have a foo function inside the ArrayStringList class and have the following code
what will be printed out? Assume that the array starts empty and has a capacity of 2.
public void foo() {
    String[] tmp = elements;
     add("a"); add("b"); add("c");
     expandCapacity();
System.out.println(tmp == elements);
```

In the ArrayStringList class, we have a private helper method expandCapcity

In the ArrayStringList class, we have a private helper method expandCapcity

```
private void expandCapacity() {
     int currentCapacity = this.elements.length;
     if(this.size < currentCapacity) { return; }</pre>
     String[] expanded = new String[currentCapacity * 2];
     for(int i = 0; i < this.size; i += 1) {</pre>
         expanded[i] = this.elements[i];
     this.elements = expanded;
When do I need to call this expandCapacity function?
    Inside the constructors 7
    Inside the insert method 41
                                      insert (0, "c") [ C ] a
2. Inside the remove method
D. Inside the get method 3
```

Inside the add method 41

```
assertEquals("paul", slist.get(0));
assertEquals("greg", slist.get(1));
              exp, actual
   In our tester for add, we wrote the code for inserting two elements and test if
   we added properly. Can I write my tester as
   assertEquals(slist.get(0), "paul");
   assertEquals(slist.get(1), "greg");
A. Yes they are basically the same as what we wrote in pre-lecture video
      No you can't switch the order as it will generate the wrong test result
       No you can't switch the order as it makes the interpretation of the test
        result inaccurate 🥏
                                 assert Equals (exp, actual)
```

public void testAdd() {

slist.add("paul");
slist.add("greg");

StringList slist = new ArrayStringList();

StringList Interface

```
public interface StringList {
 /* Add an element at the end of the list */
 void add(String s);
 /* Get the element at the given index */
  String get(int index);
  /* Get the number of elements in the list */
 int size();
 /* Add an element at the specified index */
  void insert(int index, String s);
 /* Remove the element at the specified index */
 void remove(int index);
```

ArrayList Insert

```
/* Add an element at the specified index */
void insert(int index, String s);
```

- Write a test case for the ArrayList insert method
- Implement the ArrayList insert method

ArrayList Remove

```
/* Remove the element at the specified index */
void remove(int index);
```

- Write a test case for the ArrayList remove method
- Implement the ArrayList remove method
